Voice Over Narrative

“

With the advent of the information age, there's an increase in the data leading to its abundance and companies functioning SAP are facing diverse challenges. These include unstructured data, multiple datacenters, incompatible data sources and the transformation to S/4 HANA

Having your SAP landscape on-premises or hosted, you're further being challenged with the:

- Rising costs of hardware and software, and
- The inflexibility to adopt new technologies and deploy additional SAP systems

Microsoft and SAP have partnered to help you face this last mile. Microsoft's cloud 'Azure' is a hyper-scale cloud solution with SAP-certified products, Azure is the best solution for these challenges. Azure is the most robust, scalable and secure cloud solutions for enterprises running SAP.

Getting to the Cloud isn't a journey that happens overnight, but ITPC is the best partner to help you with that, taking complete care of your migration: from planning to post-migrating operations support with a 5-step approach:

First, with a Cloud Readiness Assessment ITPC determines the opportunities, strategies, current SAP status and conducts a thorough S/4 HANA readiness check.

www.advids.co

Next, we lay the design and map with the sizing of the SAP infrastructure, where a detailed architecture design is presented with the migration plan, backup strategy, business case and cost estimation.

The third step involves the Pilot of the Sap on Azure, where the goals and the scope are defined, and tests executed.

In Step Four, the migration is planned in detail and executed. This step includes the provisioning of infrastructure, system integration, setup of high-availability and disaster recovery and implementation of backup strategy. The migration to Azure could either be a lift-and-shift migration, which involves copying the existing SAP landscape to Azure; or a migration that is combined with the update or transformation to S/4HANA.

The process concludes with the operation management, support and maintenance along with the combined offering by ITPC which includes four different service packages and three different service levels, along with 5* 24 h and 7 *24 h support model!

Being a Microsoft Partner with Gold Cloud Platform Competency and Microsoft Cloud Solution Provider Tier-1, with Local and Global Functional partners we can help you with a seamless transition to Azure Cloud.

Video Screen Play

	Scene Description	Voice Over Narrative
1	We start with showing icons for various data fade-in on screen, and increase them while running a timeline on the lower part of the screen, then we show many companies arise from this timeline and show exclamation marks above them, to depict the problems.	With the advent of the information age, there’s an increase in the data leading to its abundance and companies functioning SAP are facing diverse challenges.
2	We flip icons of the exclamations and instead show icons of • Untapped and unstructured data, • Multiple datacenters, • Incompatible data sources, • Migration to cloud,	These include unstructured data, multiple datacenters, incompatible data sources, transformation to S/4 HANA and the migration to Cloud.

	• and S/4 HANA.	
3	We cut the screen to show an illustration of the company and show the SAP on Premise, and hosted at a datacenter too, from the company we show the icons arise of “Rising cost of hardware, rising cost of software, inflexibility to adopt new tech, and difficulty of deploying new sap systems.	Having your SAP landscape on-premises or hosted, you’re further being challenged with the: - Rising costs of hardware and software, and - The inflexibility to adopt new technologies and deploy additional SAP systems
4	We show the Microsoft and the Sap logo come together and both flip, and then we see the Azure logo appear with the flip. Surrounding the Sap on Azure logo, from the logo we see all the icons of problems in the previous frame appear and they are seen getting checked off (to indicate that all these problems are solved with Azure). We flip these icons to see the icons for robust, scalable and secure.	Microsoft and SAP have partnered to help you face this last mile. Microsoft’s cloud ‘Azure’ is a hyper-scale cloud solution with SAP-certified products, Azure is the best solution for these challenges. Azure is the most robust, scalable and secure cloud solutions for enterprises running SAP.
5	We show an illustration of the company on the left side and show data icons emerging from it and merge them to the cloud illustration with S/4 HANA written on it. We show the ITPC logo in between the screen and speed up the migration process behind and show a timeline below the logo that starts from migration and concludes at operations support. The timeline splits (stretches) and we see icons of the 5 steps of the assessment process appear.	Getting to the Cloud isn’t a journey that happens overnight, but ITPC is the best partner to help you with that, taking complete care of your migration: from planning to post-migrating operations support with a 5-step approach:
6	We zoom into the first of the milestone in the timeline and show illustration of the company on screen, from which we see various icons emerge. These icons are in sync with the narrative and include: • Opportunities,	First, with a Cloud Readiness Assessment ITPC determines the opportunities, strategies, current SAP

	• Strategies, • Current SAP status and • S/4 HANA readiness check	status and conducts a thorough S/4 HANA readiness check.
7	We move on to the next milestone in the timeline and show ITPC experts from the top view, design and lay the maps and an architecture plan, backup strategy and cost estimation. Or show the experts present these to the senior members of the company in a PPT.	Next, we lay the design and map with the sizing of the SAP infrastructure, where a detailed architecture design is presented with the migration plan, backup strategy, business case and cost estimation.
8	In this frame, we show the third step of the assessment where we show the goals and the scope of pilot as an example (text and bullet points of a used case scenario).	The third step involves the Pilot of the Sap on Azure, where the goals and the scope are defined, and tests executed.
9	We show the 4th step in the timeline and then show various provisions for infrastructure pan on screen along with icons for integration of system – depicted by joining of puzzles/gears; high availability of disaster recovery – with a SOS switch and back up strategy with a rough outline  of backup plan like: We need some help/ technical content to show for this scene.	In Step Four, the migration is planned in detail and executed. This step includes the provisioning of infrastructure, system integration, setup of high-availability and disaster recovery and implementation of backup strategy. The migration to Azure could either be a lift-and-shift migration, which involves copying the existing SAP landscape to Azure; or a migration that is combined with the update or transformation to S/4HANA.

	Here we show some data and database icons simply rising from the companies and getting shifted to a cloud environment (and name the cloud as Azure?). Reference:  We add the S/4 HANA tab in between the connecting lines of the above image and depict with arrows the transformation first to S/4 HANA and then to the cloud.	
10	We show the last milestone in the timeline and show icons for support, maintenance and the different packages (as bullet points); service levels and support model branch out on screen from the milestone itself.	The process concludes with the operation management, support and maintenance along with the combined offering by ITPC which includes four different service packages and three different service levels, along with 5* 24 h and 7 *24 h support model!
11	We cut to show a world map where we show the Tags related to Microsoft Gold partner and Microsoft Cloud solution provider at the center of the map and show pins appearing on various regions globally where ITPC has successfully helped its client. (Globally)	Being a Microsoft Partner with Gold Cloud Platform Competency and Microsoft Cloud Solution Provider Tier-1, with Local and Global Functional partners we can help you with a seamless transition to Azure Cloud.

12	We cut to show the updated info of ITPC on screen which includes credentials and contact information of the company.	Contact us to know more and explore the endless opportunities
